SERVICENOW · INCIDENT MANAGEMENT

Implement Client Script & UI Policy (Incident)

Customer Journey Map | Nān Mudhalvan Project

Based on a sample ServiceNow incident scenario (VPN issue)
showing the people involved in the journey

SCENARIO

Logging, handling and resolving a VPN incident using Client Script and UI Policy

Steps
What does the person (or group) typically experience?

Interactions
What interactions do they have at each step along the way?

- **People:** Who do they see or talk to?
- **Places:** Where are they?
- **Things:** What digital touchpoints or physical objects would they use?

Goals & motivations
At each step, what is a person's primary goal or motivation? ("Help me..." or "Help me avoid...")

Positive moments
What steps does a typical person find enjoyable, productive, fun, motivating, delightful, or exciting?

Negative moments
What steps does a typical person find frustrating, confusing, angering, costly, or time-consuming?

Areas of opportunity
How might we make each step better? What ideas do we have? What have others suggested?

Entice
How does someone initially become aware of this process?

Steps	**Issue occurs** The caller (Priya) cannot connect to the company VPN while working from home.	**Contact Service Desk** The caller phones, emails or chats with the Service Desk to report the problem.	**Decide to log incident** The agent understands the issue must be tracked and decides to raise an incident.
Interactions	Place: Caller's home. Thing: laptop and VPN login screen. People: Caller (Priya).	Thing: phone, email or Service Desk portal. People: Caller and Service Desk Agent (Arun).	Place: Service Desk workspace. Thing: caller details and issue notes. People: Service Desk Agent.
Goals & motivations	Help me get my VPN working again so I can continue my work.	Help me explain the problem quickly and reach the right person.	Help me avoid losing this issue so it gets tracked properly.
Positive moments		It is easy for the caller to reach the Service Desk by phone or portal.	The agent feels confident that every issue will be tracked.
Negative moments	The caller is stressed and cannot work until the VPN is fixed.	The caller may wait on hold or give unclear details.	The agent may be unsure which details are needed for the incident.
Areas of opportunity	Offer VPN help articles on the self-service portal.	Let callers report through the Service Portal using a simple form.	Give agents a short checklist of what to ask the caller.

Enter
What do people experience as they begin the process?

Steps	**Open Incident module** The agent logs in to ServiceNow and searches for Incident in the navigator.	**Create new incident** The agent clicks the New button to open a blank Incident form.	**Form loads** The form opens with default values like Opened by, date and State = New.
Interactions	Place: ServiceNow home page. Thing: Application Navigator and Filter Navigator. People: Service Desk Agent.	Place: Incident module. Thing: Incident list and New button. People: Service Desk Agent.	Place: Incident form. Thing: Number, Opened by and State fields. People: Service Desk Agent.
Goals & motivations	Help me find the Incident module quickly so I can start helping the caller.	Help me open a clear form so I can log the issue without confusion.	Help me see correct default values so I don't type them again.
Positive moments	The Incident module is easy to find using the navigator search.	One click on New opens the form.	Default values (date, opened by, State = New) save typing time.
Negative moments	New users may not know which module or menu to open.		Many unnecessary fields on the form can feel confusing.
Areas of opportunity	Add Incident as a favourite so it opens in one click.	UI Policy: hide rarely used fields so the new form looks simple.	Client Script (onLoad): set default values such as Contact type = Phone.

Engage
In the core moments in the process, what happens?

Steps	**Enter basic details** The agent picks Caller, Category and Subcategory, then types the Short description and Description.	**Client Script runs** The form checks the data, sets values automatically and shows messages if something is wrong.	**UI Policy changes fields** Fields become mandatory, visible or read-only based on Category, Priority and State.	**Submit incident** The agent clicks Submit and an incident number is generated.
Interactions	Place: Incident form. Thing: Caller, Category, Subcategory and Short description fields. People: Agent (types) and Caller (gives details).	Place: Incident form (runs in the browser). Thing: Client Script (onChange, onSubmit), info and error messages. People: Agent. A ServiceNow Developer created the script.	Place: Incident form. Thing: UI Policy and UI Policy Actions (Mandatory, Visible, Read-only). People: Agent. A ServiceNow Administrator set up the policy.	Place: Incident form. Thing: Submit button, Priority and incident number (e.g. INC0010025). People: Service Desk Agent.
Goals & motivations	Help me enter the right caller and issue details so nothing is missed.	Help me find mistakes before I submit so I don't fix them later.	Help me see only the fields I need so I can finish the form faster.	Help me feel sure the incident is saved correctly and know what happens next.
Positive moments	Reference fields suggest matching callers and categories while typing.	Auto-filled values save time and clear messages help fix mistakes at once. A VIP caller automatically gets Urgency set to High.	The form looks clean because only the relevant fields are shown.	The incident number is generated at once and can be told to the caller.
Negative moments	The agent may leave Description empty, write a vague Short description or pick the wrong Category.	Without validation, wrong or incomplete data is accepted and must be corrected later.	Without UI Policies, important fields are missed and unrelated fields fill the screen.	An incident submitted with missing details leads to follow-up calls to the caller.
Areas of opportunity	Client Script (onChange): show a message like "Please select a subcategory" when Category changes. UI Policy: make Description mandatory when Category is Network.	Client Script (onSubmit): stop submission if Short description is empty or too short, and show an error message. Client Script (onChange): set Urgency to High when the caller is a VIP.	UI Policy: show On hold reason only when State is On Hold. UI Policy: show Resolution code and Close notes only when State is Resolved.	Show a confirmation message with the incident number after submit. Check that all mandatory fields are filled before saving.

Exit
What do people typically experience as the process finishes?

Steps	**Incident assigned** The incident reaches the right group (Network Support) and an agent picks it up.	**Incident updated** The support agent adds work notes and moves the State to In Progress.	**Resolve & close** The agent adds resolution details and closes the incident. The closed form becomes read-only.
Interactions	Place: Incident list (Assigned to me). Thing: Assignment group and Assigned to fields. People: Network Support Group and Incident Manager.	Place: Incident form, Notes tab. Thing: Work notes, Additional comments and State field. People: IT Support Agent.	Place: Incident form, Resolution tab. Thing: Resolution code, Close notes and State. People: IT Support Agent and Caller.
Goals & motivations	Help me send this to the right team so the issue is solved sooner.	Help me record every update so everyone can follow the progress.	Help me close the incident with full details so the record stays accurate and safe.
Positive moments	The right group receives the incident without delay.	Work notes make the progress easy to follow.	Resolution details are complete before the incident is closed.
Negative moments	A wrong Assignment group causes delay and reassignment.	Updates without clear notes leave the caller waiting without information.	Resolution details may be missing, and a closed incident may be edited by mistake.
Areas of opportunity	Auto-suggest the Assignment group from the Category so incidents reach the right team.	UI Policy: make Assigned to mandatory once State is In Progress.	UI Policy: make Resolution code and Close notes mandatory before resolving. UI Policy: make all fields read-only when State is Closed.

Extend
What happens after the experience is over?

Steps	**Caller confirms** The caller gets a notification and confirms that the VPN works again.	**Record kept for reference** The closed incident stays in history and can be searched for similar issues.	**Review & improve** The Incident Manager reviews repeated issues and improves scripts and policies.
Interactions	Thing: email notification or portal update. People: Caller and Service Desk Agent.	Place: Incident list and reports. Thing: closed incident record and history. People: Service Desk and support teams.	Place: Reports and dashboards. Thing: incident reports, Client Script and UI Policy lists. People: Incident Manager and ServiceNow Administrator.
Goals & motivations	Help me feel sure the problem is really fixed.	Help me find old incidents so I can solve similar issues faster.	Help me improve the form so the same mistakes don't happen again.
Positive moments	The caller is happy the issue is solved and was kept informed.	A clear history makes similar issues easier to solve.	Fewer errors over time make the form easier for everyone.
Negative moments	The caller may not reply, so the incident stays open longer.	Poor quality records are hard to reuse for future issues.	Scripts and policies may become outdated if no one reviews them.
Areas of opportunity	Send an automatic reminder if the caller has not confirmed the fix.	Ask agents to write clear Close notes so the record can be reused.	Review common mistakes and add new Client Script checks. Remove old UI Policies that are no longer needed.
