USER ACCEPTANCE TESTING REPORT

Date	3 October 2026
Team ID	SWTID-2026-3849
Project Name	Incident Client Script & UI Policy Implementation
Maximum Marks	

1. Project Overview

The project configures the Incident module in ServiceNow to provide controlled field behaviour and validation during incident processing. The implementation combines UI Policy rules with a Client Script so that selected Incident fields respond correctly to defined conditions and user actions.

2. Project Scope

• Configure an Incident UI Policy for the required business condition.

• Control the mandatory state of the Assignment group field.

• Control the editable state of the Urgency field.

• Validate Incident State changes performed through list editing.

• Confirm that valid actions are accepted and unsupported actions are blocked.

3. Testing Environment

Application	ServiceNow – Incident Module
Configuration Area	Client Script and UI Policy
Test Type	User Acceptance Testing
Test Data	Incident records representing the configured conditions

4. UAT Test Cases

ID	Test Scenario	Test Steps	Expected Result	Actual Result	Status
UAT-01	Incident form behaviour	Open an Incident record and review configured fields.	Configured field rules are applied correctly.	Behaviour matched the configured rule.	PASS
UAT-02	High Impact condition	Set the Incident to the configured High Impact condition and review Assignment group.	Assignment group becomes mandatory.	Assignment group was treated as mandatory.	PASS
UAT-03	Urgency field control	Apply the configured condition and attempt to edit Urgency.	Urgency follows the configured read-only rule.	Urgency followed the configured rule.	PASS
UAT-04	State list-edit validation	Edit Incident State from the list and submit a restricted change.	Unsupported State change is prevented.	Restricted change was prevented.	PASS
UAT-05	Valid State update	Perform a permitted Incident State update through the supported flow.	Valid update is accepted without unwanted validation errors.	Permitted update was accepted.	PASS

5. Defect / Issue Log

Issue ID	Observed Issue	Severity	Resolution	Status
ISS-01	No functional issue observed during the defined UAT checks.	Low	No corrective action required.	Closed

6. UAT Acceptance Criteria

• The configured Incident UI Policy behaves according to its defined condition.

• Mandatory-field behaviour is applied when the relevant condition is active.

• The Urgency field follows the configured edit restriction.

• Client Script validation blocks the defined unsupported State change.

• Valid Incident operations remain usable after the configuration is applied.

7. UAT Result

The configured Client Script and UI Policy functions were checked against the defined UAT scenarios. The recorded scenarios produced the expected behaviour, with no functional issue requiring correction in the listed checks.
