Performance Testing

Date	3 October 2026
Team ID	SWTID-2026-3849
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	

Performance Testing

Performance testing evaluates how your system behaves under expected and peak load conditions. This report documents the testing approach, tool used and results obtained for the Incident form Client Scripts and UI Policies. Testing was done manually in the browser as a single-user functional check; no load-testing tool was used.

Step 1: Testing Overview

Field	Details
Testing Tool Used	Google Chrome (manual testing on the ServiceNow web UI)
Type of Testing	Manual functional / behaviour testing with a single user (no load, stress or spike testing)
Target Module / API	Incident form and Incident list: UI Policy, UI Policy Action (Urgency) and onCellEdit Client Script (State)
Test Environment	Cloud-hosted ServiceNow Personal Developer Instance (PDI)
Test Date	30 September 2026

Step 2: Test Scenarios

S.No	Test Scenario / Description	No. of Virtual Users	Duration (sec)	Expected Outcome
1	On a High impact incident, leave Assigned to empty (INC0010006).	1	Not measured	Message "Assigned To is mandatory for High impact incidents." is shown; Assigned to is mandatory.
2	Set Impact to High and check the Urgency and Priority fields.	1	Not measured	Urgency becomes read-only (1 - High) and Priority shows 1 - Critical.
3	Change Impact from High to Medium on the same incident.	1	Not measured	Urgency becomes editable again, Priority changes to 2 - High, Assigned to is no longer mandatory.
4	Edit the State cell directly in the Incident list view (INC0008111).	1	Not measured	Alert "State cannot be updated using list editing. Please open the Incident." appears and State is not changed.

Step 3: Performance Test Results

S.No	Metric	Target Value	Actual Value	Status (Pass / Fail)	Remarks
1	Response Time (Avg)	< 2 seconds	Not measured	Pending	Not measured in manual testing; to be updated after timing.
2	Response Time (Max)	< 5 seconds	Not measured	Pending	Not measured in manual testing; to be updated after timing.
3	Throughput (Req/sec)		Not measured	Pending	Not measured in manual testing; to be updated after timing.
4	Error Rate	< 1%	Not measured	Pending	No errors seen in the test screenshots; not formally measured.
5	CPU Utilization	< 80%	Not measured	Pending	Not measured in manual testing; to be updated after timing.
6	Memory Utilization	< 80%	Not measured	Pending	Not measured in manual testing; to be updated after timing.

Step 4: Observations & Analysis

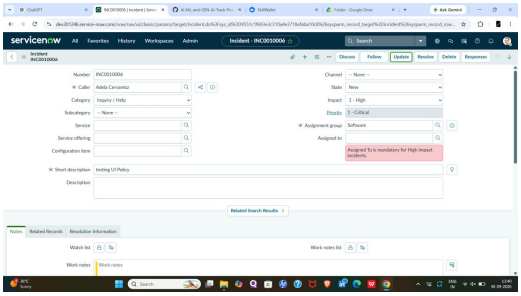

Key Findings:
All four scenarios behaved as designed on the Incident form and list view. The UI Policy enforced the mandatory field and message, the UI Policy Action locked Urgency and updated Priority, and the onCellEdit Client Script blocked State changes from list editing with a clear alert. Pages responded normally during testing.

Bottlenecks Identified:
None observed in manual single-user testing. Load, stress and spike testing were not performed, so behaviour with many users is not yet known.

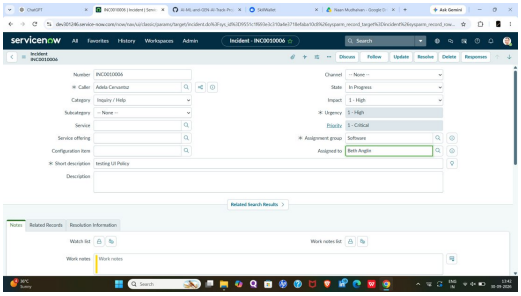

Optimization Steps Taken:
The checks run in the browser (UI Policy and Client Script), so they need no extra server request. Each script is kept short, with one script per behaviour.

Step 5: Screenshots / Evidence

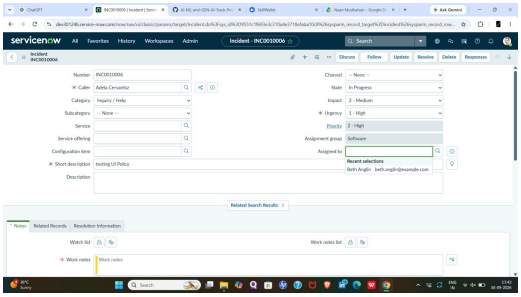

Screenshots of the tests on the ServiceNow instance (30 September 2026), in the order they were taken:

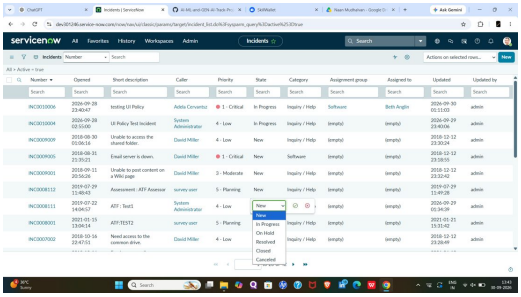

1. Impact = High, Assigned to empty: mandatory message shown (INC0010006)

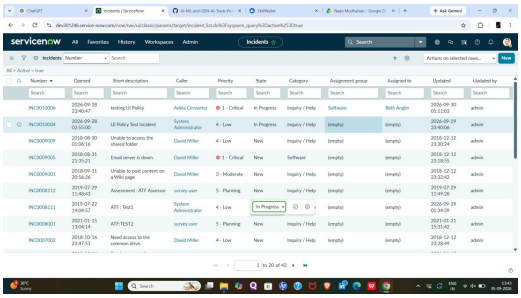

2. Impact = High: Urgency read-only, Priority = 1 - Critical

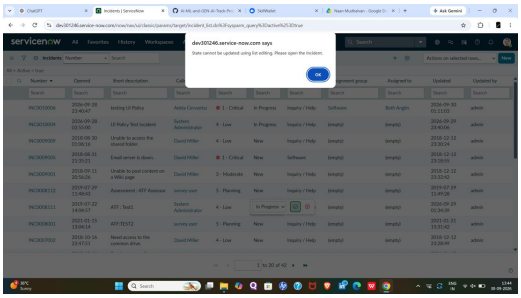

3. Impact = Medium: Urgency editable, Priority = 2 - High

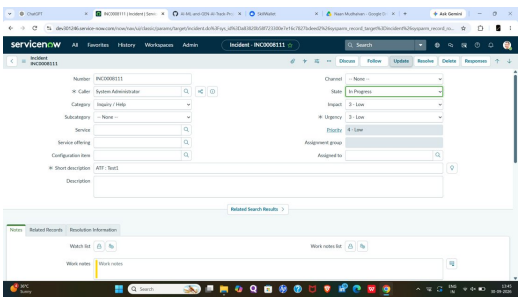

4. List view: State cell editor opened on INC0008111

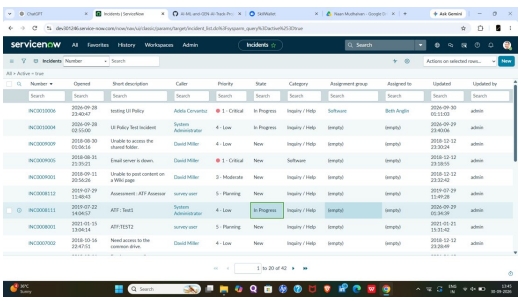

5. List view: State cell editor with In Progress selected

6. Alert: State cannot be updated using list editing

7. Incident form INC0008111: State editable on the form

8. List view after the alert: State unchanged
